

Environmental Horticulture Major

The Environmental Horticulture major serves students who seek careers in the sustainable and conventional production of vegetables, fruits, and nursery crops, as well as students who seek careers in horticulture science (i.e., graduate school), public gardens, teaching, and Extension. In addition to the required horticulture courses that serve as a foundation to this major, students can choose from several menus of courses (e.g., sustainable vegetable and fruit, sustainable green industry, horticultural science, and agricultural economics/business) to satisfy their 23 credit hours of restricted electives. This allows Environmental Horticulture majors to select a suite of courses that specifically meets their career goals.
